

Day 1 - Python Basics for Data Science

Topics Covered:

1. print() Statement
2. Variables
3. Data Types (int, float, str, list, dict)
4. Input from user
5. type() and str() functions

Code Examples:

```
print("I am Pavithra from Killinchikuppam")
```

```
X = 12
```

```
Y = 'madhu'
```

```
Z = 35.0
```

```
print(X, Y, Z)
```

```
print(X)
```

```
print(Y)
```

```
print(Z)
```

```
students_name = ['charu', 'dhivya', 'santa']
```

```
A, b, c = students_name
```

```
print(A, b, c)
```

```
my_data = {'name': 'pavi', 'age': 19}
```

```
print(my_data)
```

```
Birds = input("Enter the number of birds: ")
```

```
print(Birds)
```

```
print("I was in Achariya college of engineering")
```

```
my_hometown = "killinchikuppam"
```

```
my_dist = "cuddalore"
```

```
print("The Pavithra hometown is", my_hometown)
```

```
print("The Pavithra district is", my_dist)
```

```
print(type(my_dist))
```

```
print(str(my_hometown))
```

Output Observed:

I am pavithra from killinchikuppam

12 madhu 35.0

12

madhu

35.0

charu dhivya santa

{'name': 'pavi', 'age': 19}

Enter the number of birds: 8

8

I was in Achariya college of engineering

The Pavithra hometown is killinchikuppam

The Pavithra district is cuddalore

<class 'str'>

killinchikuppam
